

What's important here? The patient results detailed on this infographic are mostly men who are middle aged and only slightly overweight (BMI>25).

Patient Demographics

	Regenexx-SD
N	627 Procedures
Male	353 (56.3%)
Female	274 (43.7%)
Age	57 (16-92)
BMI	26.5 (14.6-46.2)

Caution! This is registry data, which is not the same as a controlled trial. This means it was collected as patients were treated.

Means of % Improvement

Fall 2015 Data

This data analysis is part of the fall 2015 data download of patients who were tracked in our advanced registry. Of note, we have noticed for many years that hips with arthritis generally under-perform knees for stem cell treatment outcomes. Studies have shown that the native stem cells in hips aren't as robust as those in knees. In general, while this data shows reasonable outcomes; to date, our data on cultured stem cells used in hip joints demonstrated better results than the same day procedure.

The graph above represents the mean of reported percentage improvement at each time point categorized by age. The graph below is the percentage of patients who reported >50% relief at the same time points after the procedure.

% of Joints Reported More Than 50% Improvement

Regenexx-SD is a same day stem cell procedure where cells are harvested in the morning and placed back in the afternoon.

There were 362 procedures performed for hip. The available outcomes for each time point were the following: 248 at 1 month, 346 at 3 months, 279 at 6 months, 191 at 12 months, 113 at 18 months, 69 at 24 months, 25 at 36 months, and 7 at 48 months.
